Understanding Fear and Trembling: Definitions and Origins

What Is Fear?

Fear is an innate emotional response to perceived threats or danger. It triggers the body's fight-or-flight mechanism, preparing an individual to confront or escape from harm. Fear can be rational, such as fearing a roaring lion, or irrational, like phobias that cause disproportionate anxiety. Its primary

function is survival, alerting us to potential risks.

What Is Trembling?

Trembling refers to involuntary shaking or shivering, often associated with intense emotional states like fear, anxiety, or excitement. It manifests physically and can be a symptom of psychological distress or physiological response to stress hormones like adrenaline.
