- Best-case analysis: Looks at the minimum running time
- Average-case analysis: Considers expected performance over all inputs

Design Strategies for Algorithms

Designing effective algorithms involves applying various methodologies suited to different problem types. Levitin categorizes these strategies into several core techniques.

Divide and Conquer

This approach involves breaking down a problem into smaller subproblems, solving each independently, and combining solutions: - Example algorithms: Merge Sort, Quick Sort, Binary Search - Process: 1. Divide the problem into subproblems 2. Conquer by solving subproblems recursively 3. Combine solutions to form a complete answer

Dynamic Programming

Dynamic programming is used for optimization problems where subproblems overlap: - Key principles: - Optimal substructure: solution depends on solutions to subproblems - Overlapping subproblems: same subproblems recur multiple times - Techniques: - Memoization (top-down) - Tabulation (bottom-up)

Greedy Algorithms

Greedy algorithms make locally optimal choices at each step with the hope of finding a global optimum: - Suitable for problems like: - Activity selection - Fractional knapsack - Huffman coding - Limitation: Not always optimal, but efficient

Backtracking

Backtracking systematically searches for solutions by exploring all possibilities and pruning paths that fail to satisfy constraints: - Applications: - N-Queens problem - Sudoku solver - Combinatorial problems

Branch and Bound

An extension of backtracking with pruning to reduce the search space: - Used in optimization problems like the Traveling Salesman Problem - Utilizes bounds to eliminate unpromising paths early
