Working Principle of Air Over Hydraulic Brakes

The core of the system lies in its ability to use compressed air to generate hydraulic pressure, which then applies the brakes. The diagram helps visualize this process step-by-step.

Step-by-Step Operation

1. **Brake Application:** When the driver presses the brake pedal, a control valve is activated.
2. **Air Signal Generation:** The control valve releases compressed air from the reservoirs into the relay valve or directly to the brake chambers.
3. **Air to Hydraulic Conversion:** The relay valve opens, allowing compressed air to act upon a hydraulic piston or chamber connected to the master cylinder.
4. **Hydraulic Pressure Build-Up:** The air pressure pushes the hydraulic piston, generating hydraulic pressure within the master cylinder.
5. **Brake Actuation:** Hydraulic fluid flows through lines to the wheel cylinders or calipers, applying brake pads or shoes against the drum or disc.
6. **Deceleration:** The friction between brake components slows down or stops the vehicle.
7. **Release of Brakes:** Releasing the brake pedal cuts off the air supply, causing the relay valve to vent air and hydraulic pressure to dissipate, releasing the brakes.

This seamless conversion from air pressure to hydraulic force allows for efficient and powerful braking, especially suitable for heavy-duty applications.

Operational Flow of the Air Over Hydraulic Braking System

Understanding the air over hydraulic brakes diagram involves tracing the sequence of operations from driver input to wheel braking. The process is as follows:

Step 1: Driver Activation

- When the driver presses the brake pedal, the pedal valve modulates the air pressure in the control line, sending a signal to the air supply system.

Step 2: Air Pressure Generation and Transmission

- The compressor replenishes air in reservoirs, maintaining system readiness. - Compressed air flows through control valves and relay valves towards the brake chambers, increasing pressure.

Step 3: Mechanical Actuation of Hydraulic Master Cylinder

- The pressurized air pushes against the diaphragm within the brake chamber. - This mechanical force actuates the hydraulic master cylinder, converting pneumatic energy into hydraulic pressure.

Step 4: Hydraulic Force Application

- Hydraulic fluid is pushed through lines to wheel brakes. - The hydraulic pressure applies pads or shoes against brake drums or discs, creating friction.

Step 5: Vehicle Deceleration

- The combined mechanical and hydraulic forces slow the vehicle. - Release of the brake pedal reverses the process, venting air and hydraulic pressure, allowing the brakes to disengage.
