Frequently Asked Medical Microbiology Questions and Answers

1. What are the main features of Gram-positive bacteria?

Answer: Gram-positive bacteria are characterized by a thick peptidoglycan cell wall that retains crystal violet stain during Gram staining, appearing purple under microscopy. They lack an outer membrane and are often more susceptible to antibiotics like penicillin. Examples include *Staphylococcus aureus*, *Streptococcus pyogenes*, and *Bacillus anthracis*.

2. How does the Gram stain differentiate bacteria?

Answer: The Gram stain differentiates bacteria based on cell wall properties: - Gram-positive bacteria: retain crystal violet stain, appearing purple. - Gram-negative bacteria: do not retain crystal violet; they are counterstained pink with safranin due to their thinner peptidoglycan layer and outer membrane.

3. What is the significance of the acid-fast stain?

Answer: The acid-fast stain is used to identify *Mycobacterium* species, like *M. tuberculosis*. These bacteria have mycolic acids in their cell walls, which resist decolorization by acid-alcohol, allowing them to retain the primary stain (carbol fuchsin). This is crucial for diagnosing tuberculosis.

6. How are viral infections diagnosed?

Answer: - Serology: Detecting specific IgM or IgG antibodies. - Molecular assays: PCR for detecting viral DNA or RNA. - Culture: Less common due to fastidious nature, but possible for some viruses. - Antigen detection: Rapid tests for influenza, RSV, etc.

7. What are the main pathogenic fungi in medical microbiology?

Answer: - Candida species (causing candidiasis) - Aspergillus species (aspergillosis) - Cryptococcus neoformans (cryptococcosis) - Dermatophytes (ringworm)

8. How do fungal infections differ from bacterial infections?

Answer: - Fungi are eukaryotic organisms with complex cell structures. - They often require longer incubation times. - Treatment involves antifungal agents like amphotericin B and azoles. - Fungal infections tend to occur in immunocompromised hosts.

9. What are common parasitic infections diagnosed in microbiology labs?

Answer: - Malaria (caused by Plasmodium spp.) - Giardiasis (Giardia lamblia) - Amoebiasis (Entamoeba histolytica) - Helminthic infections (worms like Ascaris, Schistosoma)

10. How is parasitic infection diagnosed?

Answer: - Microscopic examination of stool, blood, or tissue samples. - Serological tests. - Molecular diagnostics for specific parasites.
